

### ☐ Enterprise Resource Planning (ERP)

Research has shown that successful adoption of ERP systems can provide tremendous value in complex organizations across industries. The more complex requirements an organization has, the greater the opportunity, but the greater the exposure.

We provide expert business and technology advisory services to management. We are not ERP system integrators providing large teams of technicians and implementers. Our consultants partner and integrate within a client's ERP team to provide critical points of support.

For example, we talk to sales and marketing to understand and design complex contract and pricing environments. We talk to personnel on the shop floor to understand information flow required in the warehouse, in production, in shipping, etc. We work with the accountants and help streamline processes to close the books. Our focus is on business functionality and end results.

Our success is directly attributable to our ability to provide value to clients. Proof of this success is best demonstrated by repeat business and client references.. Clients frequently turn to us for help in tackling changing market conditions and new business initiatives.

*A **business focus** – we solve business problems*

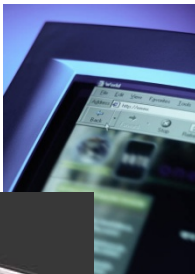

***Years of experience.***

*Average 20+ years - we get the job done*

*We are **trusted advisors** to management to ensure systems meet the specific needs of your business.*
